Subject Index of Volume 28

Artificial neural networks
and their applications to power systems — bibliographical survey, 67

Balanced power system
analysis of random sequential complicated faults on, 201
Block matrices
and their applications in power systems, 51

Circuit breakers
of transmission line, probabilistic interrupting current rating of, 165
Controllers
of power system, on-line tuning of, 41

Digital distance relay
WXB-41, with accelerated trip for faults in second zone of transmission line, development and field experience with, 171
Discriminative response indices
for numeric distance protection, 149
Distance protection
numeric, discriminative response indices for, 149
Distance relay
WXB-41 digital, with accelerated trip for faults in second zone of transmission line, development and field experience with, 165
Distribution systems
power, determination of impacts of high impedance faults on protection of, using probabilistic model, 11
radial, steady-state stability criteria and uniqueness of load flow solutions for, 81
Dynamic identification
digital, of power system subharmonics based on least absolute value, 99

Electric railway demands
unbalanced, comparison of Scott and Leblanc transformers for supplying, 235
Expert systems
and fuzzy set theory, integration of, to solve multicase VAR planning, 129

Faults
high impedance, determination of impacts of, on protection of power distribution systems using probabilistic model, 11
random sequential complicated, analysis of, on balanced power system, 201
Filter algorithm
PC based IIR, for power transformer relaying, 123
Filter design
harmonic, and system voltage profiles in presence of time varying current injection, analysis of, by dynamic system models, 59
Frequency domain transient stability simulations
parallel–vector processing synergy and, 89

Fuzzy set theory
and expert systems, integration of, to solve multicase VAR planning, 129

Harmonic filter design
and system voltage profiles in presence of time varying current injection, analysis of, by dynamic system models, 59
Harmonics
digital dynamic identification of power system subharmonics based on least absolute value, 99
Heuristic method
for real-time load flow solution of integrated multiterminal AC–DC power systems, 139
Hydrothermal electric power systems
influence of considering temporal correlation of inflows in optimal operation program of, calculated through stochastic dynamic programming, 19

IIR filter algorithm
PC based, for power transformer relaying, 123
Inflows
temporal correlation of, in optimal operation program calculated through stochastic dynamic programming, influence of considering, 19
Integrated AC–DC power system
prediction of voltage collapse in, using singular-value decomposition concept, 111
Interrupting current rating
probabilistic, of transmission line circuit breakers, 165

Line reclosing analysis technique
fast and exact, 35
Linear dynamic equivalent model
of power system, determining stability and realizability of type of identified, 211
Load flow solution
real-time, of integrated multiterminal AC–DC power systems, heuristic method for, 139
uniqueness of, and steady-state stability criteria for radial distribution systems, 81
Load forecaster
neural network short-term, 227
Load shedding
system loadability and, 217
Loadability
of system and load shedding, 217

Matrices
block, and their applications in power systems, 51
Matrix inverse factor calculations
numerically asymmetric, precedence relationship minimization in, 27
Monte Carlo models
for reliability evaluation of interconnected power systems, convergence characteristics of two, 1
Multicase VAR planning
integration of fuzzy set theory and expert systems to solve, 129

Multiterminal AC–DC power systems
integrated, heuristic method for real-time solution of, 139

Neural network
artificial, and their applications to power systems – bibliographical survey, 67
short-time load forecaster, 227

Optimal operation program
influence of considering correlation of inflows in, calculated through stochastic dynamic programming, 19
Parallel–vector processing synergy
and frequency domain transient stability simulations, 89
Power system equivalent model
linear dynamic, determining stability and realizability of type of identified, 211
Power system subharmonics
digital dynamic identification of, based on least absolute value, 99
Power transformer relaying
PC based IIR filter algorithm for, 123
Precedence relationship minimization
in numerically asymmetric matrix inverse factor calculations, 27
Pricing wheeled power
theory of, 191
Probabilistic model
determination of impacts of high impedance faults on protection of power distribution systems using, 11
Protection
numeric distance, discrimination response indices for, 149
of power distribution systems, determination of impacts of high impedance faults on, using probabilistic model, 11

Radial distribution systems
steady-state stability criteria and uniqueness of load flow solutions for, 81
Real-time load flow solution
of integrated multiterminal AC–DC power systems, heuristic method for, 139
Relaying
power transformer, PC based IIR filter algorithm for, 123
Reliability evaluation
of interconnected power systems, convergence characteristics of two Monte Carlo models for, 1
Response indices
discriminative, for numeric distance protection, 149

Sensitivity approach
improved, voltage collapse prediction using, 181
Sequential complicated faults
random, analysis of, on balanced power system, 201
Singular-value decomposition concept
prediction of voltage collapse in integrated AC–DC network using, 111
Stability and realizability
of type of identified power system linear dynamic equivalent model, determining, 211
Stability criteria
steady-state, and uniqueness of load flow solutions for radial distributions systems, 81

Time varying current injection
analysis of system voltage profiles and harmonic filter design in presence of, by dynamic system models, 59
Transformer relaying
power, PC based IIR filter algorithm for, 123
Transformers
Scott and Leblanc, for supplying unbalanced electric railway demands, comparison of, 235
Transient stability simulations
frequency domain, parallel–vector synergy and, 89
Transmission line
development and field experience with WXB-41 digital distance relay with accelerated trip for faults in second zone of, 165
Transmission line circuit breakers
probabilistic interrupting current rating of, 165
Tuning
on-line, of power system controllers, 41

Unbalanced electric railway demands
comparison of Scott and Leblanc transformers for supplying, 235
Uniqueness
of load flow solutions and steady-state stability criteria for radial distribution systems, 81

VAR planning
multicase, integration of fuzzy set theory and expert systems to solve, 129
Voltage collapse
prediction of, in integrated AC–DC network using singular-value decomposition concept, 111
Voltage collapse prediction
using improved sensitivity approach, 181

Wheeled power
theory of pricing, 191
